Ideation Phase

Brainstorm & Idea Prioritization

Date	12 October 2026
Team ID	SWUID2026403439
Project Name	IMovies - Online Movie, Event & Entertainment Ticket Booking System
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization:

A brainstorming session gives the team room to put every idea on the table before any of them is judged. The focus is on generating many ideas, building on one another's suggestions and only then deciding which ones deserve to be built. For IMovies, the team used this approach to turn the problems found in the SRS into a ranked list of features and a clear build order.

Reference: https://www.mural.co/templates/brainstorm-and-idea-prioritization

Step-1: Team Gathering, Collaboration and Select the Problem Statement

The team agreed on a few ground rules before starting:

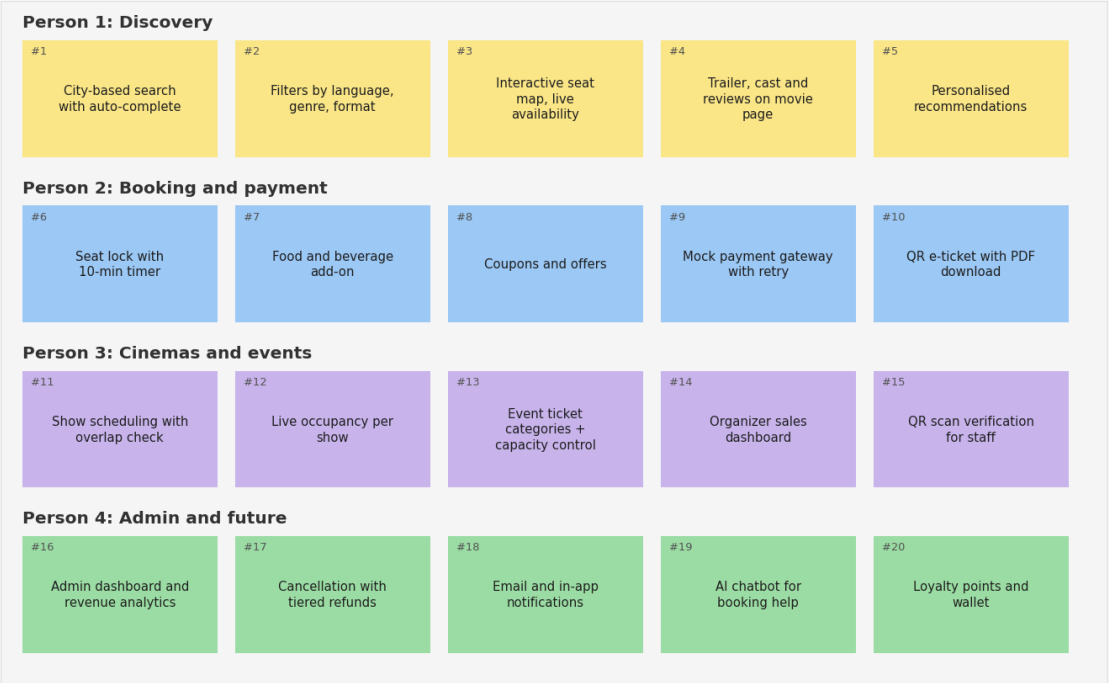

- Defer judgment: no idea is rejected while ideas are being collected.
- Go for quantity first; refine quality afterwards.
- Build on other people's ideas instead of replacing them.
- Stay tied to the problem statements and the SRS modules.

Selected problem statement (How might we...): How might we let customers find a show, pick the exact seats they want and pay without conflicts or failed bookings, while giving cinemas, organizers and admins simple tools to run shows, events, refunds and reports?

Input	Source
Problems to solve	PS-1 to PS-6 from the Define the Problem Statements document (seat conflicts, scattered listings, unclear refunds, no live occupancy, event overselling, no admin dashboard)
Scope reference	Software Requirements Specification: modules for authentication, movies, cinemas, seats, booking, payment, events, notifications, admin and analytics
Team format	Four members, each taking one area: discovery, booking and payment, cinemas and events, admin and future ideas

Step-2: Brainstorm, Idea Listing and Grouping

Each team member silently wrote down five ideas for their area, then shared them with the group. The board below shows all 20 ideas collected.

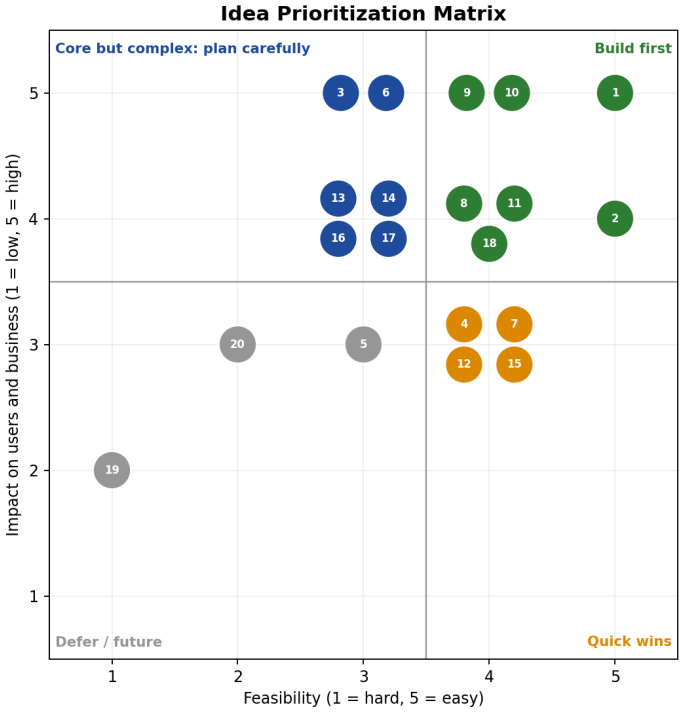

Related ideas were then grouped into six themes:

Theme	Ideas	Count
A. Discovery and search	#1 City-based search with auto-complete; #2 Filters by language, genre, format; #4 Trailer, cast and reviews on movie page; #5 Personalised recommendations	4
B. Seat selection and checkout	#3 Interactive seat map, live availability; #6 Seat lock with 10-min timer; #7 Food and beverage add-on; #8 Coupons and offers; #9 Mock payment gateway with retry	5
C. Tickets and after-booking	#10 QR e-ticket with PDF download; #17 Cancellation with tiered refunds; #18 Email and in-app notifications	3
D. Show and event operations	#11 Show scheduling with overlap check; #12 Live occupancy per show; #13 Event ticket categories + capacity control; #14 Organizer sales dashboard; #15 QR scan verification for staff	5
E. Admin and insights	#16 Admin dashboard and revenue analytics	1
F. Future innovation	#19 AI chatbot for booking help; #20 Loyalty points and wallet	2

Observation: themes B and D hold the most ideas, which matches the SRS where seat selection, locking, booking and show management are the heart of the system.

Step-3: Idea Prioritization

Each idea was scored from 1 to 5 for impact (how much it helps users and the business) and feasibility (how easy it is to build within the semester using React, Spring Boot and PostgreSQL/MySQL). The score is impact x feasibility, and the matrix places each idea in a quadrant.

Prioritized idea list (sorted by score):

ID	Idea	Impact	Feasibility	Score	Quadrant	Decision
#1	City-based search with auto-complete	5	5	25	Build first	MVP - Sprint 2
#2	Filters by language, genre, format	4	5	20	Build first	MVP - Sprint 2
#9	Mock payment gateway with retry	5	4	20	Build first	MVP - Sprint 4
#10	QR e-ticket with PDF download	5	4	20	Build first	MVP - Sprint 4
#8	Coupons and offers	4	4	16	Build first	MVP - Sprint 4
#11	Show scheduling with overlap check	4	4	16	Build first	MVP - Sprint 3
#18	Email and in-app notifications	4	4	16	Build first	MVP - Sprint 5
#3	Interactive seat map, live availability	5	3	15	Core but complex	MVP - Sprint 3
#6	Seat lock with 10-min timer	5	3	15	Core but complex	MVP - Sprint 3
#4	Trailer, cast and reviews on movie page	3	4	12	Quick win	Include - Sprint 2
#7	Food and beverage add-on	3	4	12	Quick win	Include - Sprint 4
#12	Live occupancy per show	3	4	12	Quick win	Include - Sprint 3
#13	Event ticket categories + capacity control	4	3	12	Core but complex	MVP - Sprint 5
#14	Organizer sales dashboard	4	3	12	Core but complex	MVP - Sprint 5
#15	QR scan verification for staff	3	4	12	Quick win	Include - Sprint 6
#16	Admin dashboard and revenue analytics	4	3	12	Core but complex	MVP - Sprint 6
#17	Cancellation with tiered refunds	4	3	12	Core but complex	MVP - Sprint 5
#5	Personalised recommendations	3	3	9	Defer / future	Basic popularity version - Sprint 6
#20	Loyalty points and wallet	3	2	6	Defer / future	Future enhancement
#19	AI chatbot for booking help	2	1	2	Defer / future	Future enhancement

Conclusion:

- Ideas in the Build first and Core but complex quadrants form the minimum viable product: search and filters, seat map and seat locking, coupons, mock payment, QR tickets, show scheduling, events, refunds, notifications and the admin dashboard.
- Quick wins (trailer and reviews, food and beverages, occupancy view, QR scan verification) are added when sprint capacity allows.
- Recommendations start as a basic popularity-based version; the AI chatbot and loyalty wallet are recorded as future enhancements, as listed in the SRS.
- Core but complex ideas, especially seat locking and capacity control, receive early testing because they carry the highest risk of double booking.
